

Implementing a Government-wide Semantic Solution to Thesauri

[Kenneth B. Sall](#), Science Applications International Corporation (SAIC) and

[Ronald P. Reck](#), RRecktek LLC

April 20, 2006

[XML Community of Practice](#) (XML CoP)

Town Hall at the [eGov Institute](#)'s [KM Conference](#).

Agenda

- Problem
- Goals and Requirements
- Basic Thesaurus Terminology and IC Examples
- SKOS (Simple Knowledge Organisation System)
- Our SKOS Element Subset and Extensions
- SKOSaurus Pilot
- DTIC Thesaurus Examples
- Potential Next Steps

Problem Statement

- Government agencies need common vocabulary of (technical) terminology.
- Communication and data sharing is greatly enhanced when the semantics are clear.
- Various government groups approach this in different ways -- Microsoft Word, Excel, HTML, databases, and wiki pages: bulleted lists, tables, spreadsheets, acronym lists, etc.
- Need to focus on a common formats and standards that enable reuse and harmonization across Communities of Interest (COIs).

Goals and Requirements

- Allow constraining terms to one COI or sharing across COIs.
- Should benefit from ISO standards for thesauri.
- Enable term authors to use familiar tools (e.g., Excel).
- Leverage existing Microsoft formats to access expressive backend data stores.
- XML-based (RDF) solution with few required elements but many optional and/or repeatable elements.
- Multiple definitions of the same term must be permitted, with either same or different subject/context.
- Should support semantic relationships between terms: “search thesaurus”.

% Thesauri Standards and Specifications

- **ISO 2788:1986** – Documentation - Guidelines for the establishment and development of monolingual thesauri
 - Developing a Thesaurus (mono-lingual)
 - ISO 5964:1986 – multi-lingual version
- ISO 1087:2000 - Vocabulary of Terminology
- ISO 704:2000 - Principles and Methods
- **ANSI/NISO Z39.19-2003** - Construction, Format, and Management
- ISO 15836:2003 - The Dublin Core metadata element set
- [Many more listed in paper.]

% Basic Thesaurus Terminology (1)

[ISO 2788:1986]

- *Thesaurus* – list of concepts in a particular domain of knowledge together with explicit relationships
- *Concept* - unit of thought that exists in the mind as an abstract entity, independent of the term(s) that identify it (i.e., human language independent)
- *Concept Scheme* - set of concepts, optionally including statements about semantic relationships between those concepts.
 - Thesauri, classification schemes, subject heading lists, taxonomies, terminologies, glossaries and other types of controlled vocabularies

Basic Thesaurus Terminology (2)

[ISO 2788:1986]

- ISO 2788 defines abbreviations for each thesaurus construct. These “generally recognized conventions” are useful for compactness and in automated processing.
- USE (or SEE) – *preferred* label for this concept follows
- UF = USE FOR – *alternate* label follows, may be a synonym but less preferred

– e.g., ELECTRONIC INTELLIGENCE **UF** ELINT

↑
Preferred label

↑
Alternate label

Basic Thesaurus Terminology (3)

[ISO 2788:1986]

- SN = Scope Note - to clarify or constrain the meaning
 - sometimes contains the concept's definition
- BT = Broader Than – another concept more *general* than this concept
- NT = Narrower Than – more *specialized* than this concept
- RT = Related To – concept that is *similar* in some way

Thesaurus Concept Example

MT Adult education

BT Education

BT Employee training

NT Continuing education

RT Community colleges

RT Compensatory education

RT Higher education

SN Educational programs/services, usually at the postsecondary level, for adults seeking personal, academic or occupational enhancement.

FEA Business Reference Model (BRM)

BUSINESS REFERENCE MODEL (BRM) Services for Citizens: Intelligence Operations

Intelligence Operations involves collecting and analyzing information to meet the national security challenges of the US by processing reliable, accurate foreign intelligence, and disseminating intelligence products to policymakers, military commanders, and other consumers.

- **Dissemination**
Consists of delivering the intelligence products to consumers.
- **Intelligence Analysis & Production**
Converts large amounts of data to a form suitable for the production of finished intelligence to include translation, decryption, and interpretation of information stored on film and magnetic media through the use of highly refined photographic and electronic processes.
- **Intelligence Collection**
Involves the gathering of raw data from multiple sources from which finished intelligence is produced.
- **Intelligence Planning and Direction/Needs**
Establishes the intelligence requirements of the policymakers, the President, the NSC, military commanders, and other officials in major departments and governmental agencies.

[Intelligence
Operations](#)
in the BRM

SKOS

(Simple Knowledge Organisation System)

- Leverages ISO 2788 (and ISO 5964) by defining an RDF vocabulary based on the ISO standards [implied].
- Defines an XML element (SKOS property) for each thesaurus construct (USE, UF, BT, NT, SN, etc.) and many more.
- [Semantic Web Best Practices and Deployment Working Group](#) – W3C
- [SKOS Working Drafts](#) (W3C) and Related Efforts
 - SKOS Core Guide
 - SKOS Core Vocabulary Specification
 - Quick Guide to Publishing a Thesaurus on the Semantic Web
 - Also: SKOS Mapping, Extensions, API, Development Wiki

SKOS Core

- [SKOS Core](#) - model for expressing structure and content of *concept schemes*:
 - Thesauri
 - Classification schemes
 - Subject heading lists
 - Taxonomies
 - [“Folksonomies”](#)
 - Other types of controlled vocabulary
 - Concept schemes are also embedded in glossaries and terminologies.

Source: SKOS Core Guide, November 2005

SKOS Core Vocabulary

- [SKOS Core Vocabulary](#)
 - Application of [Resource Description Framework \(RDF\)](#)
 - Can be used to express a concept scheme as an RDF graph
 - Can be linked to and/or merged with other RDF data by semantic web applications
 - Uses [RDFS Classes](#) and RDF Properties to describe Concepts and Concept Schemes
 - 26 Properties and 5 Classes

Our SKOS Element Subset and Extensions (1)

- **skos:Concept** – contains all statements about properties for a given concept
- **skos:prefLabel** – USE; preferred handle for this concept; designator. [In SKOS, no two concepts in the same *concept scheme* may have same prefLabel.]
- **skos:altLabel** – UF; alternate handle; spelling variants; *can* be used for abbreviations or acronyms (but we don't)
- **skos:related**, **skos:narrower**, **skos:broader** – associated with, more specific, or more general than this concept

Our SKOS Element Subset and Extensions (2)

- **skos:scopeNote** – constrains meaning; ISO 2788 allows definitions to appear here (but we don't)
- **skos:definition** – statement or formal explanation of the meaning of a concept
- **skos:example** – used in a sentence
- **skos:subject** – topic; can be a **skos:broader**

Our SKOS Element Subset and Extensions (3)

- Pilot Extensions (non-SKOS)
 - **ABBREVIATION_OR_ACRONYM** – very common government need (could define as `rdfs:subPropertyOf skos:altLabel`)
 - **SOURCE** - official document names and URLs are preferred, but specific names of people or agencies are acceptable; (probably could define as `rdfs:subPropertyOf skos:note`)
 - **COI** – essentially a `skos:Collection` (with a potential `skos:ConceptScheme`)

SKOS Fragment: Military Intelligence

```

  <skos:narrower rdf:resource="http://ex.com/AIR_INTELLIGENCE#concept"/>
  <skos:narrower rdf:resource="http://ex.com/ARMY_INTELLIGENCE#concept"/>
  <skos:narrower rdf:resource="http://ex.com/ESPIONAGE#concept"/>
  <skos:narrower rdf:resource="http://ex.com/NAVAL_INTELLIGENCE#concept"/>
  <!-- etc (several NTs omitted for space reasons) -->
</skos:Concept>
```

SKOSaurus Pilot

- Proof of concept
- Many simplifying assumptions
- Fabricated data (except for DTIC)
- About 100 man hours
- Ron Reck and Ken Sall
- Presented at XML 2005 Conference (Nov. 2005)

% SKOSaurus Pilot: Environment

- CGI script issues SOAP requests and uses RMI.
- The host operating system is Microsoft Windows XP with Service Pack 2.
- Dell Latitude D800 (1.69GHz) with 1G of RAM.
- The Windows XP host runs VMware 5.0 build 13124 to emulate a machine onto which the Solaris X86 operating system version 10 is installed.
- This is referred to as the guest operating system which runs the SKOSaurus system, consisting of:
 - Perl version 5.8.7 and various Perl modules
 - Java version 1.4.2.08
 - Kowari server 1.1.0 Pre2
 - XSLT stylesheets

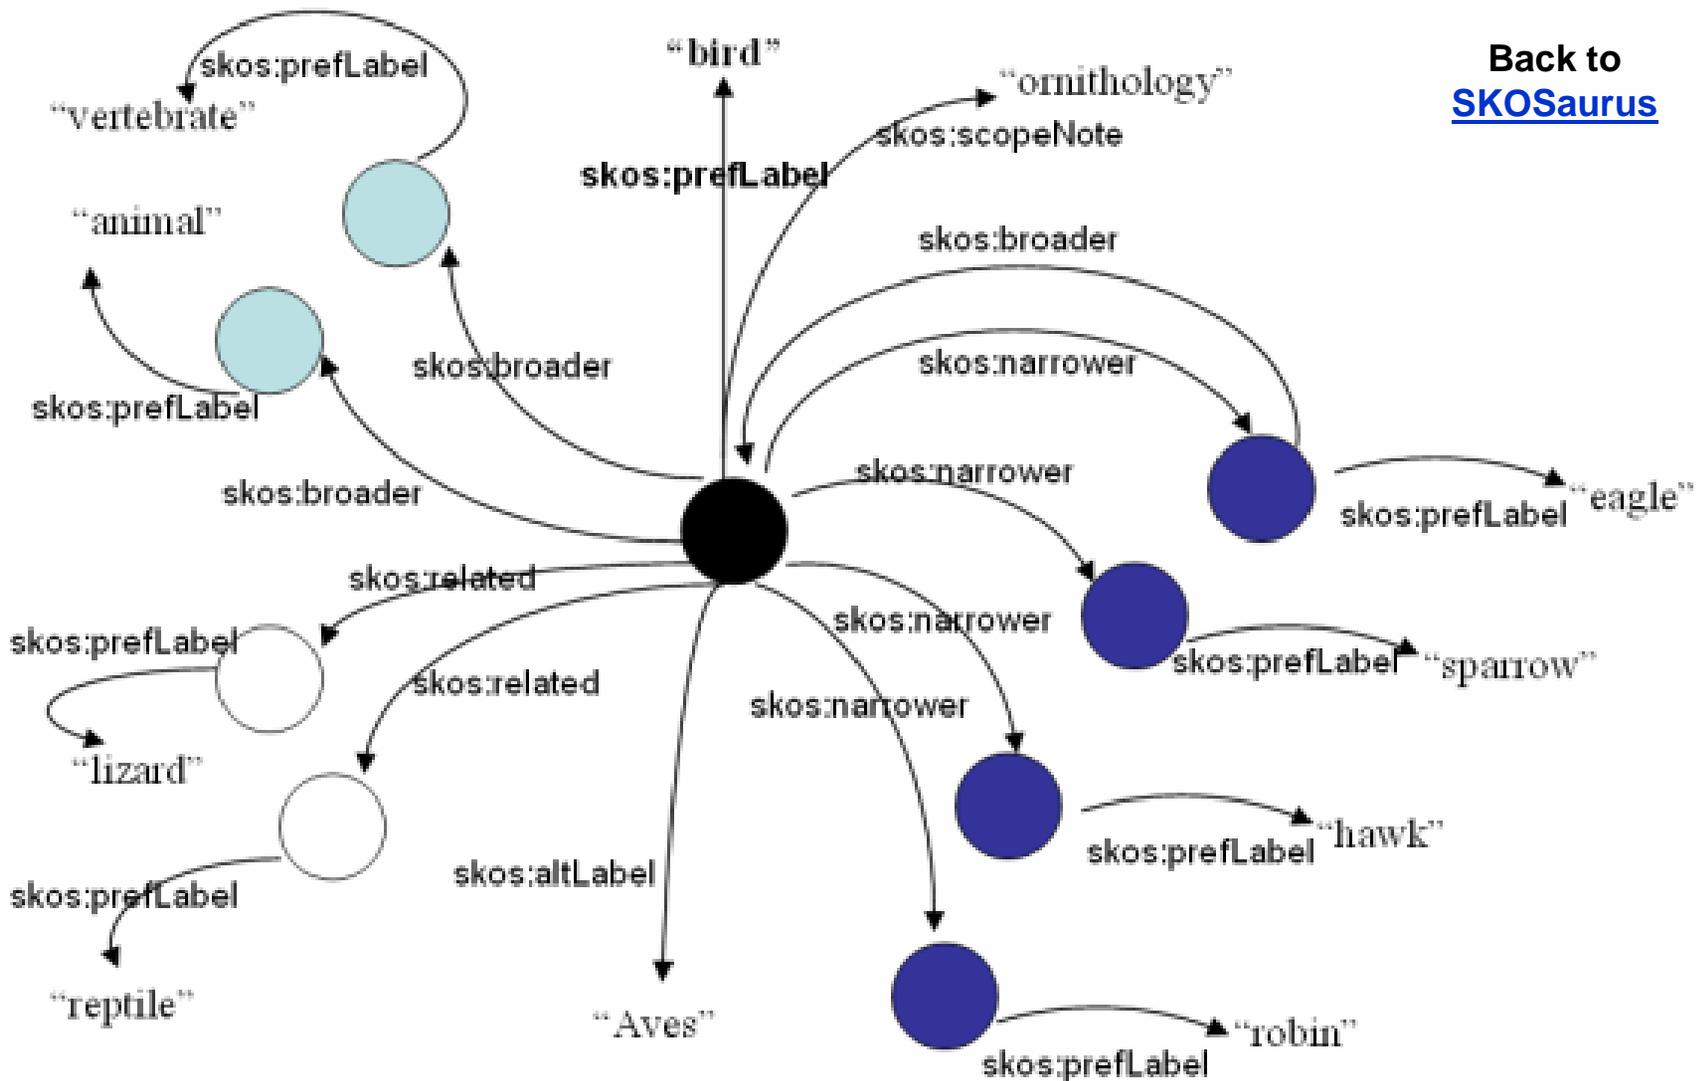

Main Use Cases (for Pilot)

- Concept Entry via Web Form
- File Upload of Excel Spreadsheet (as CSV)
- File Upload of SKOS (or RDF)
- Query of Concept Data Store

RDF Graph: Bird Example

[Back to SKOSaurus](#)

% Illustrative Statements from RDF Graph

- An alternate label (`skos:altLabel`) for "bird" is "Aves".
- The concepts with the preferred label "vertebrate" and "animal" are broader than the concept with the preferred label "bird".
- There are four specializations of birds listed ("robin", "hawk", "sparrow" and "eagle"), each indicated as `skos:narrower` than "bird".
- The concepts "lizard" and "reptile" are `skos:related` to the "bird" concept in some way.
- Among various concepts which might have the `skos:prefLabel` of "bird", the one illustrated is constrained to ornithology, according to `skos:scopeNote`. This distinguishes the concept from "bird", such as in the informal term for a (young) woman.

% OWL Statements About SKOS

- `skos:broader owl:inverseOf skos:narrower`
 - `skos:narrower owl:inverseOf skos:broader`
- and
- `skos:broader` is an `owl:TransitiveProperty`
 - `skos:narrower` is an `owl:TransitiveProperty`
-
- [RDF/OWL version of SKOS Core](#)

Example Spreadsheet: birds

prefLabel	altLabel	ABBRE	definition	subject	scopeNote
bird	Aves		warm-blooded egg-laying vertebrates characterized by feathers and forelimbs modified as wings	ornithology	ornithology
bird	chick		informal term for a (young) woman	slang	slang; more likely to be used in the UK
shuttlecock	birdie; cock; shuttle; bird		A shuttlecock is a high-drag projectile used in the sport of badminton. It has an open conical shape with a rounded head at the apex of the cone traditionally made of cork and a skirt traditionally of sixteen overlapping goose feathers.	sports	This term is applies only to the sport of badminton.
birdie	birdy		A score on an individual hole that is one stroke below par.	golf	This term applies only to golf.
eagle			any of various large keen-sighted diurnal birds of prey noted for their broad wings and strong soaring flight	ornithology	This terms refers to ornithology.
eagle			a score of two strokes under par on a hole	golf	This term applies only to golf.
Eagles			The Eagles are an American rock music group that originally came together in Los Angeles California in the early 1970s.	music	This applies only to the rock music group.
Eagles	Philadelphia Eagles		Philadelphia football team	sports	This is a football team.
robin	American Robin		The American Robin (Turdus migratorius) is a	ornithology	This terms refers to

% Spreadsheet Conventions (Pilot)

- One row per concept, sparse or densely populated.
- New row for different definition or homonym (e.g., bird). [SKOS conflict: no duplicate prefLabels.]
- The heading row should not be removed or modified.
- Column order is invariant.
- Since several elements are repeatable, use semi-colon to indicate iteration. [Configurable.]
- A limitation in our pilot parser requires the author to use the pipe symbol ("|") instead of a comma within a cell. [Config.]
- Any number of rows can be included, but there must be no blank rows or separator rows.
- File > Save As Comma Separated Values (*.csv).

How Does This Help Solve IC Problems?

- Allows concept descriptions in human-friendly Microsoft Office formats.
- Converts relationships to XML-based format; can manipulate with common XML tools.
- XML is really RDF and SKOS, which are *machine-friendly* formats. RDF was designed to be manipulated by machines.
- Semantic Web – moving from humans to machines; *we want computers to do the work for us.*
- SKOSaurus concepts are ripe for integration with commercial semantic tools: [METS](#), [Content Analyst](#), [Siderean](#), [Factiva](#), Images, etc.

Potential Next Steps

- Class of problems with CONOPS (next slide)
- Graphical interface (topicmap-like?)
- Add on Reporting Tools (paper and graphics) – analytic searching, display portions, etc.
- Search across COIs
- Access control mechanisms
- Edit existing concepts
- Ingesting other common formats
- Integration with commercial semantic products

Potential Next Steps: Class of Problems

- Glossary management
- De-confliction (detection and resolution)
- Data Reference Model (DRM) artifact problem
 - Conceptual Taxonomies
 - Conceptual Model to Logical Model
- CONOPS to be developed for specific applications of these concepts

Summary and Conclusions

- Semantic concepts help reveal less than obvious associations.
- SKOS is a useful vocabulary for implementing a thesaurus.
- The U.S. Government would benefit from a unified approach to thesauri, especially when sharing terminology within and across Communities of Interest.
- Our approach assumes government term authors want to work in Excel, not XML/RDF/SKOS (although we permit SKOS upload).
- Other SKOS implementations are worth considering (e.g., Java-based NBII SKOS Thesaurus client).
- We hope W3C considers SKOS for the [Recommendation Track](#).
